

Cranial Thermal Imaging Report

Name: Sample Cranial
Technician: Annette Adams, CTT
Imaging Center: Midwest Thermography

DoB: 03/25/1974

Date of Scan: 04/03/2026
Date of Report: 04/09/2026

Dear Ms. Cranial,

Thank you for the opportunity to review your images. The results of your scan are detailed below. To best understand these results, please read the Procedure and Limitations section below.

Relevant History: You had a root canal on November 18, 2025 on tooth #14. You occasionally have pain in that area. Your wisdom teeth were extracted.

Findings and Impressions:

1. No unusual findings in the area of tooth #18.
2. Slight relative warming is seen over the corner of the right mouth and could reflect inflammation or dental concern. The relative cooling on the left could suggest slight neuropathy.
3. No thermal indications of altered thyroid function or circulation.

Follow-up: The above findings should be clinically correlated to determine their significance if any. The impressions noted above are based upon common presentations of typical conditions but should not be interpreted as a definitive diagnosis. Evaluation by your health care provider is necessary to determine their actual cause and significance. All stated concerns in your history along with any prior examination findings should be followed up with by your doctor. Thermal imaging is not a stand-alone screening examination and cannot diagnose or rule out the presence of injury, infection or disease.

Procedure and Limitations: Thermal imaging is a temperature based physiological tool that is used in addition to standard screening and/or diagnostic examinations. It is not a stand-alone examination and cannot diagnose or rule out the presence of injury or disease. When interpreting these images, we look for unusual patterns of warmth and cooling that can suggest changes in the superficial circulation that may suggest risk for various types of injury and disease. Since the causes of most of the examination findings cannot be determined by the thermal images alone, additional examinations are always required before a final diagnosis can be made. In the absence of clinical findings, thermal findings may constitute functional changes to the body which should be monitored as they may suggest risk for illness, injury, or pain syndromes in the future. Internal organs cannot be directly evaluated with thermal imaging. Indirect findings of organ function are evaluated by looking for neurological reflexes that can potentially affect the temperature at the surface of the body. This examination was performed using a high-resolution computerized thermal imaging camera in a controlled environment after following strict pre-examination protocols to ensure the accuracy of the findings.
