

Full Body Thermal Imaging Report

Name: Sample Full
Technician: Annette Adams, CTT
Imaging Center: Midwest Thermography

DoB: 04/27/1976

Date of Scan: 05/26/2026
Date of Report: 05/28/2026

Dear Ms. Full,

Thank you for the opportunity to review your images. The results of your scan are detailed below. To best understand these results, please read the Procedure and Limitations section below.

Relevant History: You are currently taking thyroid replacement hormone for hypothyroidism. Your wisdom teeth were extracted. There is burning, aching and tightness in the back of the neck, mid back extending to the left arm. You have had right knee surgery and appendectomy, two melanoma removals and a brachial plexus repair on the right.

Findings and Impressions:

Face and Anterior Neck:

1. Bilateral warming is seen over the outer jaw and diffuse pattern likely reflecting muscle activation.
2. A hot spot is seen over the region of the thyroid on the right likely related to the existing thyroid concern.

Arms and Hands:

1. Relative cooling is seen over the right lateral wrist and digits and may reflect neuropathy.

Posterior Neck, Back and Buttock:

1. Diffuse patterns are seen over the posterior neck, upper and mid back reflecting cervical, trapezius and rhomboid muscular irritation.
2. A hot spot is seen over the left posterior shoulder likely reflecting rotator cuff trigger point.
3. Lower back spinal warming is observed suggesting mechanical compromise and joint inflammation.

Abdomen:

1. Normal temperature patterns and differentials.

Legs and Feet:

1. Normal temperature patterns and differentials.

Comments: Neck findings are consistent with those expected with an existing thyroid concern. Right wrist and hand cooling may reflect a low-grade neuropathy. Left posterior shoulder findings could indicate the presence of a trigger point potentially explaining the left arm symptoms. Additional back findings likely reflect overload and possible myofascial/mechanical irritation.

Follow-up: The above findings should be clinically correlated to determine their significance if any. The impressions noted above are based upon common presentations of typical conditions but should not be interpreted as a definitive diagnosis. Evaluation by your health care provider is necessary to determine their actual cause and significance. All

stated concerns in your history along with any prior examination findings should be followed up with by your doctor. Thermal imaging is not a stand-alone screening examination and cannot diagnose or rule out the presence of injury, infection or disease.

Procedure and Limitations: Thermal imaging is a temperature based physiological tool that is used in addition to standard screening and/or diagnostic examinations. It is not a stand-alone examination and cannot diagnose or rule out the presence of injury or disease. When interpreting these images, we look for unusual patterns of warmth and cooling that can suggest changes in the superficial circulation that may suggest risk for various types of injury and disease. Since the causes of most of the examination findings cannot be determined by the thermal images alone, additional examinations are always required before a final diagnosis can be made. In the absence of clinical findings, thermal findings may constitute functional changes to the body which should be monitored as they may suggest risk for illness, injury, or pain syndromes in the future. Internal organs cannot be directly evaluated with thermal imaging. Indirect findings of organ function are evaluated by looking for neurological reflexes that can potentially affect the temperature at the surface of the body. This examination was performed using a high-resolution computerized thermal imaging camera in a controlled environment after following strict pre-examination protocols to ensure the accuracy of the findings.

A handwritten signature in black ink, appearing to read 'R. Kane', with a stylized, cursive script.

Robert L. Kane, DC, DABCT, FIACT
Board Certified Clinical Thermologist

Diplomate American Board of Clinical Thermography
Diplomate International Academy of Clinical Thermology
Fellow International Academy of Clinical Thermology
